*An incredibly wonderful ebook with perfect and lucid explanations. I really could comprehend every little thing using this written publication. It is extremely difficult to leave it before concluding, once you begin to read the book.*

Likewise when Liebe<sup>145</sup> immersed chalk a year and a half in MgCl. solutions of various concentrations nb trace of decomposition could be detected. More successful results, however, are reported by Leitmeier,<sup>140</sup> who in his experiments on the formation of aragonite claims to have prepared dolomite also. In these experiments.1 gram of powdered CaCO<sub>2</sub> in 100 grams of water was subjected to the action of 0.01, .005, .01 and .05 gram of MgSO<sub>4</sub>·7H<sub>2</sub>O and MgCl<sub>2</sub>·6H<sub>2</sub>O respectively. At low temperatures dolomite was obtained at none of these concentrations; but at medium temperature (10 C.) a few fine grains which reacted as dolomite microchemically were obtained at the concentration of 0.1 gram. At a concentration of 0.5 gram, however, copious crystals which did not react with iron chloride were found in the residue. These showed partly developed crystallographic boundaries and appeared to possess the distorted structure characteristic of dolomite rhombohedrons. In the .1 gram solutions a much richer mixture of dolomite was obtained. The effect of higher temperatures was to produce essentially the same results, for dolomite was obtained at the same concentrations. Elements of Chemical and Physical Geology, English translation.
