The variety of hypotheses now current, which deal with the constitution of the atom, has signally failed to furnish a uniform valence hypothesis which will enable chemists to elucidate chemical formulae and reactions, or, in other words, to present more complete pictures of the relationships existing between the chemical constitution of substances and their chemical, physicochemical and physical properties. After studying the many anomalous hypotheses on atomic structure and valence, the author has adopted the early and relatively simple suggestion of Sir J. J. Thomson that if we interpret the bond of the chemist as indicating a unit Faraday tube, connecting charged atoms in the molecule, the structural formulae of the chemist can be at once translated into the electrical theory. Accordingly, the symbol - a short straight...
