Depression is a complex mental illness associated with disability and reduced quality of life for the person with depression, as well as substantial societal burden. Major depressive disorder (MDD) is the second leading medical cause of long-term disability, the fourth leading cause of global burden of disease, and is predicted to become the second highest cause of disability by 2020. Depression exerts a negative impact on physical health; it reduces adherence to medical treatment, reduces participation in preventive activities, and increases the likelihood of risk factors such as obesity, smoking, and sedentary lifestyles. MDD may be associated with immune dysfunction and cardiovascular disease, endocrine and neurological diseases, and a general increase in chronic disease incidence. Pharmacological agents are one of several treatment modalities used for depression, and one of the most frequently utilized classes of antidepressant medications are the selective serotonin reuptake inhibitors (SSRIs). The rate of treatment response following first-line treatment with SSRIs is moderate, varying from 40 to 60 ; remission rates vary from 30 to 45 . Up to one-third of persons taking antidepressant medications will develop...
