The estimated efficiency  $E_{z_b}$ , if load imbalance were the only source of inefficiency would be  $s \cdot p \cdot T_c$  3. 2 Load Balance: Self-Executing Do consider Much of the load imbalance we saw in the prescheduled do consider loop can be corrected. During any wavefront  $j \cdot \min(m, n) - 1$ , where  $j$  is not a multiple of  $p$ , there are  $p - j$  idle processors. When  $j$  is a multiple of  $p$ , no processors are idle. The failure to balance is essentially an end-effect; e. g., a wavefront has  $p \cdot q - 1$  work units with equal computational demands, but only  $p \dots$
