Excerpt: .and consequently, like all other freely moving currents, then begin to exercise a power of lateral draught, and thus induce that preponderance of the external pressure which causes the act of absorption. But it is impossible to advance a step further in the study of the physiology or pathology of the circulation until the term capillaries is clearly defined, and some attempt is made to confine within reasonable bounds their healthy powers and uses. In an anatomical point of view, many eminent men seem to think that the term capillaries should be restricted to those cylindrical intermediate tubes vessels take no part whatever in the causation of either process; the active power, which induces both effusion and absorption, being, in the healthy state, wholly derived from the columns of blood contained within those vessels. In concluding this brief recapitulation of the views contained in my...
