Typical results are indicated in Figs. 6, 7, 8, etc. These processes may be numbered for convenience 1, 2 and 3 in the order in which they occur. Processes 1 and 2 are in general of about equal duration for a given salt. The abruptness of transition, however, varies greatly, and in some instances the change of slope is so gradual as to encroach seriously on process 2 at both ends. The Influence Of Temperature. The only previous instances of decay of phosphorescence in which the later stages are more rapid than those preceding are noted by Ives and Luckiesh¹ in their study of the influence of temperature on phosphorescence, and by E. H. Kennard² in a more recent paper. Ives and Luckiesh measured the phosphorescence of one of Lenard and Klatts sulphides (BaBiK from Leppin and Masche). This substance was found to be very sensitive to change of temperature and the results at 0 C., 22 and 35, when plotted for 7-12 any time in the usual manner, gave curves varying greatly in slope. The curve for 0 is concave towards the time axis, that for 22 linear and that for 35 strongly convex. They show that a linear relation may be obtained for each of these curves by varying the exponent of I . The effect of temperature in the case of the phosphorescent sulphides, where one has to do with a composite of many overlapping bands of..
