Excerpt: . . . thermal laws applicable to all bodies. To this extension and generalization chiefly, attention is invited in this chapter. But before entering upon that subject, it is well to familiarize ourselves with the various equivalent algebraic forms in which the theorem of Carnot is usually expressed. By the law of Joule, the work of an engine, receiving q from the source and giving q_0 to the refrigerator, without waste, or the total dynamical value of the heat used, is $E(q-q_0) 2fPd p$. But by Carnot's theorem, $7 r o (T T_o)$; therefore $2 Pd p E(g-q) E q-(r-r_0)$, which is the complete analytical expression of the two laws. As perfect engines have all the same duty, $!-JL 1l L-zli$; (119) $q r q$ which gives always the constant ratio, $Ll f . . , (120) o (o (Jo (o$ this result may be thus enunciated: between the same temperatures, the ratio of the quantity of heat given to the refrigerator to the total quantity received by any substance, or system, is constant for all bodies working in cycles of Carnot; and is equal to the ratio of the corresponding temperatures. Equation (119) may be written thus: $At Aq q Aq r q q q q$ And as this is true for all values, it is true when the variation is infinitesimal, or: etc. (121) $r q q q$ to which constant ratio (122) Clausius gives the rather obscure name of equivalence-value It is evident that these different forms simply express...
