The operator passes the blade, a, behind and below the epiglottis, and draws the valve slightly forwards and upwards;he then raises his finger from the spring, S, when the blade, b, advances to a, and the epiglottis is held gently between them. The blades, a and b, are a quarter of an inch broad, slightly convex from side to side (the convexity being directed forwards), and covered with india-rubber. would specially call the attention of inventive Chap. V. laryngoscopists to this subject, as I believe that a thoroughly effective instrument for drawing forward the epiglottis would be, without exception, the most usefule addition to the art of laryngoscopy. In my pincette the anterior blade curves round, so that it can be passed behind and under the epiglottis, whilst the posterior blade, which alone moves,...
