Excerpt: . . . and end-of-month storage volumes estimated from (Edwards and Glysson, 1988); otherwise, grab samples were obtained in the centroid of flow. At area-capacity curves were obtained from the Office of times, no water was present in the canals, and no the State Engineer. The estimated daily inflow and samples were collected. outflow discharges recorded on each sampling date Samples of the interstitial pore water in the were compared to the corresponding USGS discharge reservoir bottom sediment were collected during the measurements. Because the estimated inflow early spring and the summer to determine the potential discharges were higher than the measured inflow for nutrients to move between the bottom sediment discharges for both Jackson and North Sterling Reser-and the overlying water column. Cores were obtained voirs (about 25 percent and 15 percent higher, respec-with a gravity-driven coring device outfitted with tively), a correction factor was applied to the estimated acrylic core tubes at sites in the deepest parts of each daily inflow records for these two reservoirs. reservoir, as potential for development of anaerobic conditions at the sediment water interface was greatest Data Analysis at the deepest locations. Two sites were cored in each reservoir to compare and contrast results; however, Reservoir water quality and productivity are only one site was cored at Riverside Reservoir because affected to a large extent by the amount of external and it has a sandy bottom that made retaining material in internal nutrient...
