

Reaction monitoring in multiphase systems: Application of coupled in situ spectroscopic techniques in organic synthesis

Filesize: 9.75 MB

Reviews

Thorough manual! Its this kind of excellent study. It really is written in straightforward terms and never difficult to understand. I am very happy to inform you that this is basically the very best pdf we have read through during my individual existence and could be the greatest ebook for possibly.

Cuvillier Verlag Feb 2012, 2012. Buch. Condition: Neu. Neuware - The benefit of coupling different in situ spectroscopic methods (ATR-FTIR / UV-vis / Ramanspectroscopy) is exemplarily demonstrated by the means of two reactions as application examples: the Lewis acid mediated formal [3+3] cyclocondensation reaction of a diene with aketenacetale and the heterogeneously catalysed asymmetric hydrogenation of imines. For both reactions new reactors (deep-temperature cell, probe autoclave) have been developed enabling in situ measurements under real reaction conditions. For the [3+3] cyclocondensation reaction it was demonstrated that the nature of the formed product depends on the different intermediates formed between the ketenacetal and the acids (complexation or acid catalysed rearrangement reaction). Furthermore the mechanisms of similar reactions (including other Lewis acids like AlCl₃, Al₂O₃ and TiO₂ or substrates like N-salicylideneaniline) could be successfully elucidated. The effectiveness of the hydrogenation depends on the specific interaction of the tested ketimines with the phosphoric acid ester used as chiral modifier. This interaction is mainly influenced by the used solvent and leads to the formation of a carbocation (CH₃OH) or a contact ion pair in (CH₂Cl₂, CF₃CH₂OH). Furthermore, the detected strong adsorption of imines and modifier on the Pt/Al₂O₃ catalyst affect their efficiency and activity in the reaction. 140 pp. Englisch.
