## Pelagic Sharks: Fisheries Management and Conservation - Past, Present and Future

By Juan C. Levesque

Nova Science Publishers Inc. Paperback. Book Condition: new. BRAND NEW, Pelagic Sharks: Fisheries Management and Conservation - Past, Present and Future, Juan C. Levesque, Highly migratory species (HMS) are fish stocks that often have trans-oceanic movements and life cycles. Tunas, billfishes, swordfish, and sharks are taxa which comprise HMS. Historically, pelagic shark population dynamics and biology have been difficult to study given their migratory nature and open-ocean habitat. Displaying large-scale migration patterns and crossing international management boundaries, pelagic sharks are susceptible to many international fisheries at various life stages. Pelagic sharks are slow-growing, late-maturing, long-lived, and produce few offspring, resulting in slower and much more reduced population recruitment than most marine species. These life history characteristics make pelagic sharks vulnerable to overexploitation by global commercial and recreational fisheries and elevate concerns of their long-term survival. While it is widely accepted that pelagic sharks are K-selected species and at-risk to overfishing throughout various life stages, domestic and international fishery managers have yet to develop effective methodologies for managing pelagic sharks. Most shark species are classified as fully fished, overexploited, already depleted, or commercially extinct. Others are poorly researched and their stock status is classified as uncertain and unknown. Despite there are...
