Reviews

This published publication is wonderful. Of course, it is actually engage in, still an interesting and amazing literature. It is extremely difficult to leave it before concluding, once you begin to read the book.

The experimental facts which must be understood are the following: (1) Nickel chemisorbs hydrogen molecules dissociatively down to liquid nitrogen temperature The reaction is considered to take place with little or no activation energy. (2) Copper which is similar to nickel except that it contains a filled 3d band does not dissociatively chemisorb hydrogen molecules, although copper strongly absorbs hydrogen atoms The ability of nickel to dissociatively chemisorb hydrogen is generally ascribed to the unfilled d band of the nickel. The aim of this investigation is to understand the role of the electronic structure of a transition metal, particularly the d electrons, in determining its catalytic activity.
