### **Reviews**

*It is one of the best publications. It is definitely simplistic but exciting in the 50% of the ebook. I am very happy to let you know that this is basically the greatest publication I have gone through within my own existence and could be the greatest PDF for ever.*

The leaves of the wild.cornel have been known to exhale twice their own weight of water in twenty-four hours. Some idea of the demand from above upon the water supply below may be gained from these facts. Besides the vital process, by which water is conveyed from cell to cell, the moisture is drawn up from the earth through the tissues of the plant, just as the oil of a burning lamp is drawn up by capillary attraction, and so long as the supply equals the demand, the plant remains fresh, or turgid: when evaporation ceases in consequence of the extreme moisture of the surrounding air, the current of water also ceases to flow. It is found that those trees which put out only a definite number of leaves in the spring, and do not increase their foliage in summer, are those that transpire most rapidly; and if every other portion of the tree be destroyed, the current will still maintain a steady flow through the woody fibre; it is therefore inferred that the current of water induced by evaporation has no immediate and necessary connection with the processes of growth and nutrition. In many plants possessed of a thick cuticle, all the evaporation takes place through the stomata; its amount then depends upon their number and character. The stomata developed upon the vegetation of our high and arid Western plains, the cactus, for...
