Determination of the Alkalinity.--The alkalinity of thin juices must be determined frequently and is of great importance in the carbonation and sulphitation process. It is estimated with normal or tenth-normal acid by titration. (For preparation, see Chapter XV.) Phenolphthalein is generally employed as an indicator. In neutral or acid solutions this indicator is colorless but the faintest excess of an alkali produces a bright-red color. A normal acid is a solution of acid in water; and a liter contains the equivalent weight of the active element in grams. This also applies to normal alkali solutions. A normal solution of sulphuric acid therefore contains 49 grams (the molecular weight of sulphuric acid is 98) of the pure acid to the liter, hydrogen being the active element. In this case, the molecular weight must be divided by 2 in order to obtain its equivalent weight: 1. A normal solution of hydrochloric acid contains the full molecular weight (36.5 grams) to the liter, as here only one atom of hydrogen is present. In preparing a normal sodium hydrate solution (NaOH) a liter must contain 40 grams of the salt, the sodium being the active element. The alkalinity is...
