Now in equation 1 let the increments diminish without limit, then  $d v v dp p$  from which we obtain by integration  $\int \frac{1}{v} dv = C - \log p$ ,  $t v = O p^{-1}$ , or  $v \propto p^{-1}$ . 3 From equation 2, when the increments diminish without limit,  $dp \propto p^{-1}$  and integrating, as before,  $\log S.T = (1-\gamma) \log p + C$ ,  $r = C p^{(1-\gamma)}$ . 4 Those two equations, 3 and 4, represent, therefore, the relations between the pressure, volume, and temperature of gas undergoing expansion without loss or gain of heat from without. For steam  $\gamma$  is 48 divided by 37 or 13, and equations 3 and 4 become  $p \propto v^{-13/48}$ . 5  $T \propto p^{-1}$ . 6 It must be remembered that these equations hold good only on the condition that the steam expands as a fixed gas, that is to say, without condensation, a condition which is complied with in rare cases only, as will be shown immediately. A diagram may be drawn from equation 5 by finding a few values of  $v$  by means of common logarithms, and setting off a few points on the curve as before. The curve produced is shown in Fig. 2, marked b, the one marked a being the hyperbola obtained from equation 1, page 13, and representing expansion by Boyle's law. The divergence of the two curves at first is very considerable, but as they recede from o they gradually converge again. They never meet, however, and the interval between them...
