Excerpt from Medical Annals of the District of Columbia, 1939, Vol. 8: Successor to Washington Medical Annals, the Bulletin of the Medical Society of the District of Columbia; Official Publication of the Medical Society of the District of Columbia The patient on 3 feedings a day and 27 units of protamine insulin had a blood sugar of zero, while on 20 units of protamine insulin the fluctuation was between 60 and 80 mg. The patient who had the appendectomy had been receiving 8 units of protamine insulin before the operation. Afterwards, no insulin was needed while the patient was in the hospital on a lower caloric diet. The day after the child returned to the camp on a full diet, the fasting blood sugar was 270 mg., but without any insulin this was down to 150 mg. By pm. The blood sugar remained within normal limits and no insulin was needed up until the time of discharge, which was 2 weeks after the operation. All the other patients were discharged on an increased dosage from that administered when first at..
