Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Excerpt from *Methods of Quantitative Organic Analysis* the student taking up quantitative organic analysis will find at the outset how greatly it differs from the corresponding work in inorganic chemistry. The methods employed in the latter are so much simpler, more rapid, and above all, so much more capable of giving accurate results. They are essentially based on ionic reactions in which the time factor scarcely enters at all and they admit of exhaustive systematic generalization; thus, all soluble chlorides can be estimated by precipitation with silver nitrate, soluble sulphates by precipitation with barium chloride, and so on. With due care such processes admit of very accurate results. It is different in the case of organic substances, where the ionic theory has little if any application, and reactions are governed by a whole series of factors of which time is by far the most important. The influence of time is one which must never be overlooked even in what may appear to be the simplest of reactions. It pervades almost every type of chemical interchange - hydrolysis, oxidation, reduction and the formation of condensation products.
