Bottom-water sampling: Prior to coring at each sampling site, bottom-water samples ( approximately 1 meter above the sediment-water interface ) were collected for subsequent analysis of dissolved-mercury speciation by cold-vapor atomic fluorescence spectroscopy ( CVAFS ) using a high-displacement peristaltic pump and a tethered length of rigid fluoroethylene polymer tubing. These samples were used to replace overlying water in cores collected from each site for incubation. 2. Dissolved Oxygen ( DO ): Consumption of dissolved oxygen was monitored for each incubated core using a micro-Winkler titration method ( Fig. 14; Kuwabara and others, 2000 ). 3. Dissolved Mercury: Mercury samples from water-column sampling, and core incubations were filtered with 0.7-micrometer quartz membranes that had been baked for 6 hours at 500 degrees centigrade to remove residual organics. Filtered samples were acidified with quartz-distilled nitric acid ( pH less than 2 ), and refrigerated in darkness until analyzed...
