For instance, suppose we should construct the graph of $(x^2 + 1)$ independently. For any value of x , the point representing $(a + 1)$ would be one unit higher than the point representing x^2 ; thus the graph of $(z^2 + 1)$ would be the graph of x^2 raised one unit. We can, however, get the same effect more easily by leaving the graph where it is and lowering the r -axis one unit. In the same way, the graph of $(x^2 - 2)$ can be obtained from the graph of x^2 by raising the z -axis two units. Again, suppose we should construct the graph of $(z+1)^2$; in the table of values of x and $(r + 1)^2$, we should have the same set of values for $(z+1)^2$ that we had for x^2 , except that the corresponding value of x would be one less. This means that the graph of $(x+1)^2$ is the graph of x^2 shifted one unit to the left, or is the graph of x^2 with the y -axis shifted one unit to the right. In the same way, the graph of $(x-2)^2$ can be obtained from the graph of x^2 by shifting the $-/$ -axis two units to the left. These considerations are perfectly general, and may be applied to any function: The graph of $f(x) + a$ can be obtained from the graph of $f(x)$ by shifting the x -axis a units downward; and The graph of $f(x...$
