A pressure cooker works on a simple principle: Steam pressure. A sealed pot, with a lot of steam inside, builds up high pressure, which helps food cook faster. When was the pressure cooker invented? It was invented in the 1600s by a Frenchman by Denis Papin, who wanted to translate new discoveries in physics about pressure and steam into cooking. He called his pot the Digester but it took quite a while before better manufacturing standards and technology could make these high pressure pots safe. How does a pressure cooker work? A pressure cooker is a sealed pot with a valve that controls the steam pressure inside. As the pot heats up, the liquid inside forms steam, which raises the pressure in the pot. This high pressure steam has two major effects: Raises the boiling point of the water in the pot. When cooking something wet, like a stew or steamed vegetables, the heat of your cooking is limited to the boiling point of water (212F). But with the steam s pressure now the boiling point can get as high as 250F. This higher heat helps the food to cook faster. Raises the pressure, forcing liquid into the food. The high pressure also helps force liquid and moisture into the food quickly, which helps it cook faster and also helps certain foods, like tough meat, get very tender very quickly. The extra-high heat of the pressure cooker also promotes caramelization and browning in a surprising way - we re not used to food caramelizing when it is cooking in liquid. But the flavors created in a pressure cooker can be really deep...
