The manner of occurrence in the shales, also, as a short and comparatively thick mass which follows down the dip of the shales, would not be so difficult of comprehension. The shales are so cleaved that they usually come apart more readily on the cleavage planes than on the stratification. It is this character that makes it so difficult to collect fossils from them. It would seem that the explosive action occurring on the formation of a volcanic vent through them would have opened them vertically along the cleavage planes instead of following the inclined stratification slope. If the lava solidified where it now rests, the only possible explanation of the occurrence is that we have here a volcanic throat or neck. The nature of the rock...
