Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1898 Excerpt: .with a view to applying the electrical resistance pyrometer to the phenomena of thermo-electricity. The method was suggested by Professor Callendar, whose work, with that of Messrs. Griffiths, Heycock, and Neville, has fairly well established the formulas for calculating temperature by this means. The object of the investigation was to give a more rigid verification of Tait's parabolic formula. The research, as conducted, naturally divides itself into three parts: --1. The study of the usual form of copper-iron junction. 2. The study of a cast-iron wrought-iron junction. In conducting some experiments on the cyclical variation in the cylinder wall of a steam-engine, Professor 8. A direct comparison of the electrical resistance pyrometer with the platinum-platinum-rhodium couple. In all cases the compensation method was used for measuring the E.M.F., the junction being balanced against a storage cell, which in turn was continuously balanced against a Clark cell kept at constant temperature. A carefully calibrated rheostat and a resistance box, both of the same material, were used. The copper, cast-iron, and wrought-iron were tinned together at one end and heated in an oil bath, in which also was inserted the tube containing the pyrometer. The observations were taken only at perfectly steady temperatures. The direct reading galvanometer, devised by Professor Callendar for the purpose, was used in taking temperatures with the pyrometer. A carefully calibrated resistance box of the standard type was also used. The platinum temperatures were calculated from the formula  $t = 100 \sqrt{w}$  and the air thermometer...
